                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PHARMACEUTICAL: Available under the name Enbrel (Immunex and Wyeth-Ayerst). Used to treat moderate to servere rheumatoid arthritis (RA). Enbrel consist of the extracellular ligand-binding portion of TNFR2 linked to an Immuglobulin Fc chain. It binds to TNF-alpha and blocks its interactions with receptors. SIMILARITY: CONTAINS 4 TNFR-CYS REPEATS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC domain (TM) of a membrane spanning protein. The method comprises
CC modifying a nucleic acid encoding a death domain (DD) lacking membrane
CC spanning protein (e.g. Trail Receptor without Intracellular Domain; TRID)
CC by replacing the nucleic acid encoding the TM of the DD-lacking
CC membrane spanning protein with a candidate nucleic acid sequence to
CC produce a nucleic acid encoding a modified DD-lacking membrane spanning
CC protein. The modified nucleic acid is then transfected into a host cell,
CC which expresses a DD-containing receptor. The absence of apoptosis of the
CC host cell is determined following exposure of the transfected cell to an
CC apoptosis inducing ligand. Candidate nucleic acids encoding TM prevent
CC modified death domain-lacking membrane-spanning protein can also include
CC modified death domain-lacking membrane-spanning protein can also include
CC a FLAG-TRID clone, which was used in the method of the present sequence is
CC a FLAG-TRID clone, which was used in the method of the present invention.
CC This sequence comprises human TRID protein and the FLAG-epitope tag. The
CC FLAG-epitope is a useful marker to purify proteins encoded by the
CC modified DD-lacking membrane-spanning protein. The identified TM and
CC cell suicide and tissue homeostasis, and to evaluate, interfere and treat
CC events, such as cell proliferation and cell-cell signalling pathways.
                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

disorders, substantially altered (whether increased or decreased) levels of TRID gene expression can be detected, therefore the TRID polypeptides, nucleic acids and antibodies are useful in the diagnosis of such immune system related disorders. Mutations of the TRID gene can also be detected. TRID can also be used to identify ligands which may be useful in the treatment of apoptosis related disorders. TRID is administered to humans at a parenteral dose of 0.01 to 1 mg/kg/day.
                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a human TRID (TRAIL (TNF-related apoptosis-inducing ligand) receptor without an intracellular domain). TRID is a member of the tumour necrosis factor receptor (TNFR) family also known as TNFR-5. TRID is expressed in haematopoletic tissues and other normal human tissues. For a number of immune system related other normal human tissues.

Crysteine-rich receptor of the tumour necrosis factor receptor TRAIL, i.e. TRAIL-2 The invention is related to novel receptors for TRAIL, i.e. TRAIL-2 Cree AAY05725) and TRAIL-3. TRAIL-3 is highly glycosylated. It is a putative glycosylphosphatidylinositol-anchored protein, which is ceither cell-associated or processed and secreted. Secreted TRAIL-R3 competes for the binding of TRAIL to TRAIL-R1 and/or TRAIL-R2, thereby acting as an inhibitor of apoptosis. Expression of TRAIL-R2, thereby acting as an inhibitor of apoptosis. Expression of TRAIL-R3 is restricted to peripheral blood lymphocytes and composite the second of the analysis of the advancement, severity or effects of an immunological disease involves administering a TRAIL-R2 or TRAIL-R3 blocking agent such as a soluble TRAIL-R (preferably a method of treating cancer involves administration of antibodies against TRAIL-R3 or TRAIL-R2. A method of intodies capable the second of the

                                                                                                                                               CC receptor polypeptides: APO4, APO6, APO8 and APO9 or their active fragments, and isolated TWF related ligands 1 and 3 (TNRL1 and TNRL3) or CC their active fragments. APO4 is useful for diagnosing prostate cancer CC by determining levels of APO4 is useful for diagnosing prostate cancer CC by determining levels of APO4 is useful for identifying selective by determining levels of APO4 is useful for identifying selective be treated using APO4 selective binding agents linked to a therapeutic CC molety. APO4 polypeptides are also useful for identifying selective CC binding agents, useful in diagnosis/treatment of disease by binding of CC agents to the polypeptide/active fragment which is extracellular, or CC expressed on the cell surface. The binding is preferably performed in CC vivo. APO4 polypeptides/active fragments are also useful for screening CC or agonists and antagonists by binding and observing the changer in APO4 activity. Effective pharmacological agents useful in diagnosis or CC treatment of disease are also identified using APO4 polypeptides/active CC with a cytoplasmic domain of APO4 and detecting a change in level of APO4 activity. The method is performed in vitro. APO6 polypeptides are also indendified using APO4 polypeptides are also indendified using APO4 is also CC are all useful as immunogens for preparing antibodies. APO4 is also constraints. APO8 was transfected to human breast carcinoma cell line CC abnormalities. APO8 was transfected to human breast carcinoma cell line

This polypeptide comprises human Apo-2DcR, a novel member of the tumour necrosis factor receptor family that binds to Apo-2 ligand. The samino acid sequence was deduced from the nucleotide sequence of an isolated cDNA clone (see AAV84347); an alternative translation
                                                                         New Apo-2DcR polypeptide - used for apoptosis, e.g. in neurodegeneration
                                                                                                                     WPI; 1999-095340/08

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           initiation site in this clone will encode a polypeptide (see AANA88409) comprising amino acid residues -40 to 269 of Apo-2DcR shows more sequence identity to DR4 (60%) and Apo-2 (50%) than to other apoptosis-linked receptors. The polypeptide can be obtained by expression in host cells using the vector deposited as ATCC 209087. The invention provides vectors and host cells for recombinant production of Apo-2DcR polypeptides, antibodies, and transgenic and knockout animals (useful e.g. for screening and developing drugs that protect against excessive apoptosis). Apo-2DcR, or chimeras comprising Apo-2DcR or its (claimed) cextracellular domain fused to a heterologous polypeptide are used to modulate apoptosis of mammalian cells (claimed) and/or NF-kappaB activation by Apo-2 ligand, and may be expressed in vivo or ex vivo for gene therapy. They can be used in methods for the modulation and diagnosis of apoptosis e.g. in cases of neurodegeneration, cand diagnosis of apoptosis e.g. in cases of neurodegeneration, cand candense diseases and inflammation. Most human tumour cells do not express Apo-2DcR transcripts, but normal tissues do, suggesting that Apo-2DcR may permit selective killing of cancer cells by Apo-2 ligand, possibly by protecting normal, but not cancerous, cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AMU12172-AAU12446 represent novel human secretory and transmembrane CC PRO polypeptides. The PRO polypeptides are useful to detect other CC PRO polypeptides, to link bioactive molecules to cells expressing CC PRO polypeptides, to modulate biological activities of cells expressing CC PRO polypeptides, and to detect the presence of mammalian lung, colon, CC breast, prostate, rectal, cervical or liver tumours by comparing PRO CC polypeptide expression in a cell sample to that in a control sample. CC some of the 275 sequences are also useful to stimulate the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, the CC proliferation or differentiation of chondrocytes, the proliferation or CC gene expression in pericyte cells, the release of proteoglycans from CC cartilage, the proliferation of inner ear utricular supporting cells or of T-lymphocytes, the release of a cytokine from peripheral blood CC monocytes (PBMCs), or the proliferation of endothelial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by Skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide CC molecules involved in binding interactions. The polynucleotides encoding CC PRO polypeptides can be used to generate probes, antisense RNA/DNA, cc transgenic or knock out animals and can be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

Apo-2006 shows homelogy to apoptosis-linked receptors of the tumour checking factor receptor family, such as DR4 and Apo-2. The invention provides polynucleotides (see AAF30050-62) encoding novel human PRO proteins (see AAF30108-20) including PRO366. Claimed compositions comprising these proteins or their agonists are useful for increasing infiltration of inflammatory cells into a tissue of a mammal, comprising a property cells into a tissue of a mammal, comprising a property cells into a tissue of a mammal, comprising a property cells into a tissue of a mammal, comprising a property compositions comprising a property of the apoptosite of T-lymphocytes in a mammal in response to an antigen. Claimed compositions comprising a PRO polypeptide or its antagonist comprising a PRO polypeptide, an agonist antibody or an antagonist antibody. The disorder is selected from systemic lupus erythematosus, the disorder is selected from systemic lupus erythematosus, composition in the property of the disorder is systemic sclerosis, idiopathic inflammatory compositions of the property of the disorder is systemic sclerosis, idiopathic inflammatory compositions of the property of the property of the disorder is syndrome, systemic vasculitis, sarcoidosis, autoimmune thrombocytopaenia, autoimmune autoimmun

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cells and certain haematopoietic cells, to regulate antiviral responses and to prevent certain autoimmune diseases after stimulation of TRID by an agonist or TRAIL binding facilitator. The antibodies which bind TRID polypeptides are useful for treating and/or preventing diseases associated with increased or decreased apoptotic cell death. The TRID polynucleotides, proteins, antibodies, agonists and antagonists are useful in the diagnosis, treatment or prevention of: (a) cancer; (b) autoimmune disorders; (c) diseases associated with increased apoptosis; (d) cardiovascular disorders; and (e) viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nootropic, neuroprotective, antiviral, antiinflammatory, anticonvulsant, antiparasitic, cardiant, anti-HIV, antiparkinsonian and vasotropic activities, and can be used in gene therapy. The TRID polynucleotides are useful for detecting complementary polynucleotides. TRID proteins an polynucleotides are useful in the treatment of tumours, resistance to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         05-JAN-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC PRO agonist or antagonist; a retroviral gene therapy vector comprising a CC PRO nucleic acid; and methods of inhibiting or stimulating endothelial CC cell growth, cardiac hypertrophy or PRO-induced angiogenesis via the CC administration of a PRO protein, or an agonist or antagonist thereof. PRO nucleic acids, PRO proteins, antibodies against PRO proteins, PRO CC agonists and PRO antagonists may be used as therapeutic agents to treat CC ardiovascular, endothelial or angiogenic disorders, such as CC atherosclerosis, osteoporosis, myocardial infarction, hypertension, CC diabetic retinopathy, rheumatoid arthritis, Crohn's disease, PRO ricelia, CC disease, or stroke. PRO nucleic acids are additionally useful in the CC screen libraries to isolate cDNAs with sequence identity to PRO proteins, CC to map genes encoding PRO proteins, to analyse genetic disorders, and in CC gene therapy. PRO nucleic acids can also be used to produce transgenic annuals useful for the development and screening of potential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

The invention also relates to vectors and host cells comprising a PRO nucleic acid, the recombinant production of a PRO protein, PRO antibodies specific for a PRO protein, fusion proteins comprising a PRO protein, agonists or antagonists of a PRO protein compounds which inhibit the expression of a PRO gene. The invention additionally encompasses methods of identifying modulators of PRO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             expression or activity; diagnosing a cardiovascular, endothelial or angiogenic disorder, or a susceptibility to such a disorder by detecting mutations in a PRO gene within a particular tissue; treating a cardiovascular, endothelial or angiogenic disorder via the administration of a PRO protein, PRO nucleic acid, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid for producing a PRO polypeptide, analyzing genetic disorders and treating cardiovascular, endothelial or angiogenic disorders, such as atherosclerosis, wounds or cancer -
                          FLAG-epitope tag; transmembrane domain; death domain; apoptosis; cell suicide; tissue homeostasis; cell proliferation; cell-cell signalling; Trail Receptor without Intracellular Domain; TRID.
                                                                                                                                                           FLAG-TRID clone with a transmembrane
